User Guide

Dispatch Watch 1.0

August 2026

Download, filter, classify and report ICAO NOTAMs, AIP SUPs, TAFs and the Flight Schedule — built for ASL Aviation Group flight dispatchers.

14	Troubleshooting

1. Getting started

Dispatch Watch is the flight-dispatch tool used to download, filter, classify and report ICAO NOTAMs, AIP SUPs, TAFs and the Flight Schedule for the network. It runs on Windows and is installed on your local machine, but shares its database and reports on the V: drive with every other dispatcher.

First launch

- 1 Run the “**Install Dispatch Watch**” shortcut from V: (first time only). The app copies itself to your machine, creates a desktop shortcut, and restarts automatically — you do not need to do anything else.
- 2 On every later launch, just use the desktop shortcut. The app checks V: on startup and updates itself automatically whenever a newer version has been published there.
- 3 The app downloads the shared database from V: at startup and uploads your changes back to V: when you close it — keep the app open while you work, and close it normally (do not force-kill it) so your changes are saved.

Tip: the app window opens maximized. All tabs are listed along the top: NOTAM Filter, NOTAM Report, AIP SUP Report, Conflict / Email, TAF Analysis, Flight Schedule, APT List, RWYs, Keywords, Admin.

Where things live

What	Where
Shared database (NOTAMs, classifications, Flight Schedule cache, station list, runways)	V: (downloaded locally at startup, uploaded back at close)
Exported PDF reports	V:\TAY Ops Control Centre\Flight Dispatch\AIP SUP - Notams report\Reports
This User Guide	V:\...\NOTAMS APP\Dispatch Watch - User Guide.pdf — also linked directly from the Admin tab

2. Multi-user mode — Writer and Reader

Dispatch Watch is used by several dispatchers at once, but only **one dispatcher at a time can make changes** (Keep/Ignore NOTAMs, classify impacts, update the Airport List, run TAF Analysis, etc.). That dispatcher is the **Writer**. Everyone else opening the app is a **Reader** — they see everything live, but any action that would change shared data is blocked with a short explanation.

Becoming Writer

- If nobody else currently holds the lock (or the previous Writer's session went stale), you become Writer automatically — nothing to do.
- If someone else is already the Writer, you are shown a dialog: *"Dispatch Watch is already in use by: <email> since <time>. Continue as read-only Reader, or take over as Writer?"*. Choose **Continue as Reader** to just watch, or **Force Writer** to take over immediately.

If you get switched to Reader mode mid-session

If a colleague forces a takeover while you are the Writer, you get a pop-up that you must click through — it will not silently disappear or go unnoticed:

You've been switched to Reader mode by <colleague@email>.
Restart the application if you want to switch back to Writer mode.

Two buttons are offered: **Continue in Read-Mode** (keep watching, read-only) or **Restart the Application** (relaunches immediately so you can take Writer back). Before switching you, the app automatically saves whatever you had to V:, so nothing is lost.

Note: write-triggering buttons are disabled in Reader mode, and if you try to click/edit something that requires Writer access anyway, you get a short pop-up naming the current Writer's email.

Inactivity auto-save

If you are the Writer and leave the app idle for more than 2 minutes, it automatically uploads your changes to V: in the background and shows a small, non-blocking confirmation in the bottom-right corner of the screen — you do not need to do anything.

NOTAM Filter tab — all NOTAMS checked for the day.

3. NOTAM Filter tab

This is the tab you use every day to triage new NOTAMS. It opens automatically when you launch the app, showing the first airport that still has unchecked NOTAMS.

Top bar

Button / field	What it does
Filter New NOTAMS (green)	Switches to the automatic triage view (see below).
DB Update (black)	Downloads the latest NOTAMS from the ICAO web service and refreshes the local database. The label next to it shows when this last completed — run it at the start of your shift and whenever you want the freshest data.
ICAO box + OK	Type any ICAO code and press Enter (or click OK) to jump straight to that station's NOTAMS — useful to review a specific airport outside the normal triage flow.

Triaging a new NOTAM

For each airport with unchecked NOTAMS, you get a dark airport card (ICAO, IATA, runway table and a diagram) followed by one card per new NOTAM. Each card shows:

- The NOTAM key and validity dates
- The full NOTAM text, with your configured highlight keywords bolded in red (see the Keywords tab)
- **Keep / Ignore** buttons
- A row of coloured **impact chips** — the app pre-suggests one or more of these automatically based on the NOTAM text; you can always override the suggestion
- A remark box (and, for AIP SUP references, a second small box for the SUP number)

Impact codes

Code	Meaning
A — AP CLSD	The aerodrome (or every one of its runways) is closed
N — No ILS	The instrument approach is out of service, with no equivalent runway available
C — CAT I	A genuine downgrade from CAT II/III to CAT I somewhere at the airport, with no better runway remaining
D — Not ALTN	The airport cannot currently be used as a diversion alternate
F — Fuel	A refuelling restriction or outage
M — MISC	Operationally relevant but doesn't fit another code
SUP (separate checkbox)	The NOTAM references an AIP Supplement — tracked independently of the impact code, with its own reference number field

Tip: The suggestions are a starting point, not gospel. They are tuned from real dispatcher corrections, but you know the operational picture better than any regex — always read the NOTAM text and adjust the chips if the suggestion looks wrong. Every correction you make is quietly logged and used to keep improving the suggestions over time.

Nothing is written to the database as you tick chips and type remarks — it is all staged locally until you press **SUBMIT** at the bottom of the page (or press Ctrl+S), which saves everything at once and marks those NOTAMs as checked.

Looking up one station manually

Type an ICAO in the top-right box and press Enter (or click OK) to see that station's NOTAMs: already-Kept NOTAMs on the left (read-only), and every NOTAM for that station (kept, ignored, or new) as interactive cards on the right. Unlike the automatic triage flow, changes here save immediately — there is no SUBMIT button.

NOTAM Report tab — summary view, organised by fleet and impact category.

4. NOTAM Report tab

Shows a summary table of every Kept, impact-classified NOTAM, grouped by fleet (Long Haul / Short Haul) and by impact category, with a coloured header per category. It loads automatically when you open the tab and refreshes whenever you change the time-window filter (No filter / Next 24Hrs / 7 days / 31 days) at the top.

- Rows with a yellow background are active within the next 24 hours.
- Click any NOTAM reference to jump straight to that station's Kept NOTAMs on the NOTAM Filter tab.

AIP SUP Report tab — every SUP-referencing NOTAM, with its Aviobook status.

5. AIP SUP Report tab

Lists every Kept NOTAM that references an AIP Supplement, with the same time-window filter and Print/Export controls as the NOTAM Report tab.

Column	Meaning
IATA	Station, colour-coded yellow when the SUP is effective within 24 hours
Notam Ref	The underlying NOTAM key
From–Till	The SUP's own validity window
Avio	A checkbox — click it to mark whether this SUP has been loaded into Aviobook yet (green check = yes, red = not yet). This updates immediately, no Save button needed.
AIP SUP Ref	The extracted SUP reference number. “Not found on eAIP” means the reference couldn't be matched automatically — worth a manual check.

Conflict / Email tab — the top banner explains exactly how matches are computed, then each impact category follows.

6. Conflict / Email tab

This is the tab that ties everything together: every Kept, impact-classified NOTAM is cross-referenced against the Flight Schedule, so instead of a flat list of NOTAMs you see exactly **which scheduled flights are actually affected**, and how. It reloads automatically every time you open the tab.

Below is a summary of operational impacts on the network over the next 7 days, cross-referenced against the flight schedule for both B737 and B747 fleets.
For Origin/Dest, a conflict is checked at STD/STA ± 1 hr.
For ALTN use, the conflict check is only performed once an OFP has been computed in FPM.
The check is done at STD + flight time + diversion time ± 2 hr.

The two $\pm$ window values are configurable on the Admin tab if operational needs change.

No ILS 0 conflicts

CAT I 2 conflicts

LBSF
IATA: SDF
Sofia Airport

09: CAT 1 3300m 27: CAT 1 3600m

Each conflict card: airport header + runway diagram, the exact scheduled flights it affects, then the NOTAM's own schedule and full text.

Reading a conflict card

Each card shows:

- The airport header (ICAO, IATA, name, runway table and a small diagram)
- One chip per matching flight, e.g. “TAY4862 LGG-MLH — destination — STA 18-08 03:10Z” — the checkbox lets you dismiss a match you know is a false positive (it will not reappear for that specific flight)
- The NOTAM's own D)-field schedule (click the small triangle to expand it)
- The NOTAM key, its overall validity period, and its full text

Sections are ordered by severity: **AP CLSD**, **No ILS**, **CAT I**, **Fuel**, **Not ALTN**, then **MISC**. Each section header shows a count badge on the right, dimmed grey when there are currently zero conflicts for that category — the section still shows so you always know it was checked, not skipped.

The Not ALTN section additionally lists every Kept 'Not usable as an alternate' NOTAM active in the coming 7 days, even without a matching flight.

Not ALTN — two parts

Whether a station is usable as a diversion alternate does not depend on any specific flight touching it, so this section is split in two:

- **Confirmed diversion conflicts** — a real match against a flight's actual filed alternate (checked against the flight-plan data once FPM has computed it), shown as a full card exactly like the other categories, highlighted in red.
- **Not as Alternate NOTAMs active in the coming 7 days** — every other Kept "Not ALTN" NOTAM, listed as a compact row (mini diagram + full text), sorted by start time, with a yellow tint on anything active within 24 hours. These are not tied to a specific flight — they are just a heads-up on which stations are currently off the alternates list.

 PPR NOT ALLOWED DUE TO WORKS ON RWY

MISC NOTAMs get their own purple banner and are never matched against the flight schedule.

MISC

MISC NOTAMs are operationally relevant but do not fit any of the other categories, and are never cross-checked against the Flight Schedule at all — they simply appear under a purple banner, listing every Kept MISC NOTAM active at some point in the coming 7 days.

CAT I

Every card follows the same layout regardless of category — airport header, matching flight(s), NOTAM schedule and text.

Sending the report by email

Button	What it does
✉ Send Reports	Emails today's three PDFs (NOTAM Report, AIP SUP Report, Flight Schedule) to the recipient list below, with this exact Conflict report as the email body. Checks first that all three PDFs actually exist for today — export them first if you get a warning.
Update Recipients	Opens a small dialog to add or remove email addresses from the distribution list — shared across the team, stored centrally.

Note: If you are a Reader, both buttons still work for viewing, but adding/removing a recipient or sending will show the standard read-only warning.

7. Flight Schedule tab

Shows every scheduled flight the app knows about for the next 7–14 days, combining three sources in priority order: the fleet-planning web service, ASL's Movement Manager XML feed, and (only as a last resort, for flights the other two haven't published yet) an FPM CSV export dropped into a shared folder.

Columns

Date, Callsign, Origin, Dest, Reg, STD, STA (all UTC), plus — once a flight plan has actually been computed — **Flight Time**, **Alt 1 / Time to Alt 1**, **Alt 2 / Time to Alt 2**, and Crew. A hidden **Force Conflict** button per row lets you manually attach a Kept NOTAM to a flight the automatic matching missed — useful for an edge case the Conflict tab's own logic doesn't catch.

Tip: Rows already involved in a Conflict-tab match are tinted light red, so you can spot affected flights at a glance without leaving this tab.

Refreshing

The Flight Schedule refreshes itself automatically (throttled to once every 5 minutes) whenever you open this tab, the Conflict / Email tab, or the TAF Analysis tab — you do not normally need to do anything. Click **Refresh** to force an immediate update regardless of the 5-minute throttle. Every refresh also re-saves the Flight Schedule PDF automatically, so it is always current for **Send Reports**.

TAF Analysis tab — the Network Overview, organised exactly like the NOTAM Report: by fleet, then by category.

8. TAF Analysis tab

Downloads today's TAF (forecast) for every Airport List station and automatically flags anything that breaches a threshold — visibility, cloud ceiling, wind, thunderstorms or snow — colour-coded red (CAT I-level breach), amber (advisory tier) or blue (a forecast trend recovering back above threshold).

Running an analysis

Click **TAF Analysis** at the top. This downloads and re-analyses every station's TAF and rebuilds the whole report — do this at the start of your shift and whenever you want fresh data; it is not automatic.

Note: “TAF Analysis has not been run during this session”: if you click **Send TAF Report** without having clicked **TAF Analysis** at least once since opening the app, you get a warning before sending, since the stored report could be left over from an earlier session (or another dispatcher). You can still send anyway if you are confident it is current.

NETWORK OVERVIEW

Same layout as the NOTAM Report: one section per fleet (Long Haul / FedEx / Charters), each split into Ceiling & Visibility, Wind, Thunderstorms and Snow. Only the flagged trend-group block is shown (e.g. TEMPO 1400/1406 08010MPS -TSRA BKN030CB), not the whole TAF, so you see exactly the hours and conditions responsible — with the wind speed/gust portion bolded and thunderstorm/snow keywords highlighted in red within the block.

The editable report body, with the Attach Image / Bold / Italic / Underline / colour toolbar just below the threshold fields.

Editing the report

The report text is directly editable — click into it and type. A small toolbar (**Attach Image**, **B** / **I** / **U**, and four colour swatches) lets you format the selected text or drop in a picture (e.g. a satellite image), which becomes part of the shared report for every dispatcher. Edits save automatically when you leave the tab, and again just before sending.

Thresholds

Eight values control the colour-coding — a CAT I and an advisory tier each for visibility, ceiling, wind (kt) and wind (m/s). They are shown and editable directly on this tab (not on Admin, since they are your day-to-day working values); change them and click **Save Thresholds**.

Check vs Schedule

At the very top of the report (both here and in the emailed copy), a “Check vs schedule” section cross-references every red (CAT I) flagged station against flights in the **next 24 hours**, verified against the flagged block’s own hours — not just “any flight today”. It is organised into the same four categories, always shown (with “Nil” when nothing currently qualifies), so you can tell at a glance whether weather is really about to bite a specific flight.

Sending

Send TAF Report emails the current report to its own recipient list (**Update TAF Recipients**) — kept separate from the Conflict / Email tab’s list, since TAF distribution and NOTAM/conflict distribution are usually different audiences.

APT List tab — the master station list, driving which airports every other tab downloads/analyses.

9. APT List tab

The master list of every airport the app tracks. This list drives which stations **DB Update**, **TAF Analysis** and the Flight Schedule callsign filter actually cover — if a station is missing here, none of the other tabs will see it.

Column	Meaning
ICAO / IATA / Airport Name	Auto-filled from the ICAO code where possible
Long Haul / FedEx / Charters	Tick whichever fleet(s) operate through this station — colour-coded to match the reports (blue / purple / green)
Del	Removes the station

Use the search box to filter by ICAO/IATA. Type a new ICAO in the blank row at the bottom to add a station — the app looks up its name automatically and imports its runways from open data immediately.

*						

RWYs tab — editing the runway table for one station, including the manually-entered CAT capability.

10. RWYs tab

Per-runway data for every station on the Airport List — distance, heading and threshold coordinates are imported automatically from open data, but **the CAT capability column (Max APPCH) is always manual**, since that is not published in the same open dataset.

- Pick a station from the dropdown at the top.
- **Re-import CSV** refreshes the distance/heading/coordinates from open data without touching your manually-entered CAT values.
- **+ Add RWY** adds a blank row; **Save** commits your edits.

Tip: Keep the CAT column accurate — it directly drives the automatic CAT I / No ILS suggestions on the NOTAM Filter tab and the diversion-suitability checks on the Conflict tab.

Keywords tab — words highlighted in bold red wherever they appear in a NOTAM's text.

11. Keywords tab

The list of words that get bolded in red wherever they appear in a NOTAM's text on the NOTAM Filter tab — a quick visual aid while triaging (e.g. CLSD, ILS, FUEL, OUT OF SERVICE). Type a word in the box and click **Add**; select one and click **Remove selected** to delete it. Changes apply immediately to every NOTAM card.

Dispatch Watch 1.0
[Open User Guide](#)

Admin — Archive service endpoints

Flight Schedule Service URL (getFlightList)

Briefing Service URL (getBriefing)

Flight Schedule – callsign prefixes to keep (comma-separated)

Conflict tab – window around STD/STA (± hours)

Conflict tab – Not ALTN window around estimated alternate arrival (± hours)

Movement Manager XML messages folder

Flight Sched CSV folder (shared – every dispatcher's fallback CSV drop)

Weather Service URL (getAdHocMET, TAF Analysis tab)

Admin tab — version, User Guide link, and every configurable service endpoint / working value.

12. Admin tab

The first line shows the current app version (**Dispatch Watch 1.0**), with a direct **Open User Guide** link to this document right below it.

Setting	What it's for
Flight Schedule / Briefing Service URL	The two fleet-planning web service endpoints — only change these if IT tells you the address has moved.
Callsign prefixes to keep	Which operators' flights are kept in the Flight Schedule (default TAY,FDX,DHL) — comma-separated.
Conflict tab window (± hours)	How far around a flight's STD/STA a NOTAM is considered a conflict (default 1h).
Not ALTN window (± hours)	Same idea, but around the estimated arrival time at a filed alternate (default 2h).
Movement Manager XML messages folder	Network share ASL's Movement Manager exports into — only change if IT tells you the path has moved.
Flight Sched CSV folder	Shared drop folder for the FPM CSV fallback export.
Weather Service URL	The endpoint the TAF Analysis tab downloads from.

Note: These are advanced/IT-level settings — most dispatchers will never need to change anything here beyond the callsign filter or the conflict windows. Click **Save** after any change.

13. Daily workflow checklist

A typical shift, start to finish:

- 1 Launch the app — confirm you became Writer (or knowingly continue as Reader).
- 2 On the **NOTAM Filter** tab, click **DB Update** to pull the latest NOTAMs.
- 3 Triage every new NOTAM — Keep/Ignore, check the suggested impact chips, adjust and submit.
- 4 Open **Flight Schedule** (or just let it refresh in the background) to make sure today's flights are current.
- 5 Open **TAF Analysis** and click **TAF Analysis** to pull today's weather.
- 6 Review the **Conflict / Email** tab — this is your single view of everything that actually affects a scheduled flight.
- 7 Export the **NOTAM Report** and **AIP SUP Report** to PDF (Flight Schedule's PDF saves itself automatically on every refresh).
- 8 Click **Send Reports** on the Conflict / Email tab to distribute the daily briefing.
- 9 Click **Send TAF Report** on the TAF Analysis tab to distribute the weather briefing.
- 10 Close the app normally at the end of your session so your changes upload to V:.

14. Troubleshooting

Symptom	What to do
"Reader mode" warning when I try to do something	You are not the current Writer. Either wait for the current Writer to finish and relaunch, or use Force Writer if it is urgent — the previous Writer's work is auto-saved before you take over.
I got kicked to Reader mode mid-session	A colleague forced a takeover. Click through the pop-up; use Restart the Application if you need Writer access back right away.
Report / TAF looks out of date	Check whether DB Update / TAF Analysis / Flight Schedule's Refresh has actually been run this session — opening a tab does not by itself re-download new data (except the Flight Schedule's own throttled auto-refresh).
Send Reports says a PDF is missing	Export the NOTAM Report and/or AIP SUP Report to PDF first (top of those tabs) — Flight Schedule's PDF saves itself automatically.
A NOTAM's suggested impact looks wrong	Just correct it — every correction is logged and helps tune the suggestion engine over time. Don't worry about "breaking" anything by overriding a suggestion.
An airport is missing from a report	Check it exists on the APT List tab with the right fleet flag(s) ticked.
Runway diagram or CAT capability looks wrong	Check/edit the RWYs tab for that station — the CAT column especially is always manual.

For anything not covered here, contact your OCC/IT point of contact.
